Problem Statement

According to Nielsen's The GaugeTM, the percentage of Netflix streaming viewership in the US, has hovered around 8% for the last year (The Gauge, 2024). There has even been a **decline of 0.9% in recent months**, going from 8.4% in June 2024 to 7.5% in October 2024.

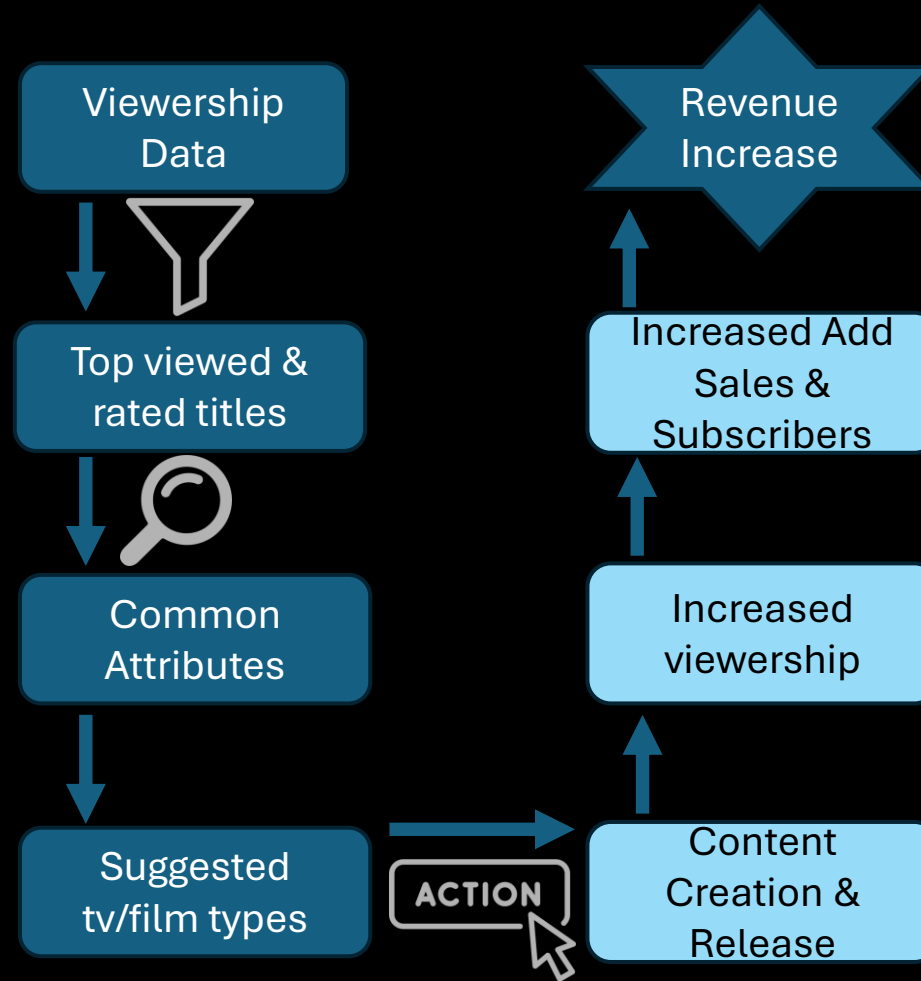

This shows Netflix's stagnant state in the US streaming wars. We need to focus on increasing our share by increasing viewership through **top notch content**. Leading to increased add sales, subscriptions, and ultimately revenue.

Solution

If the goal is to increase Netflix's percent of the US streaming market, we need to **focus on creating and providing the types of shows and movies that keep viewers engaged.**

In order to do so, we need find out **what attributes make a TV show or movie obtain high viewership & ratings.** We will be analyzing the top films and shows on the platform from 7/4/2021 to 3/31/2024.

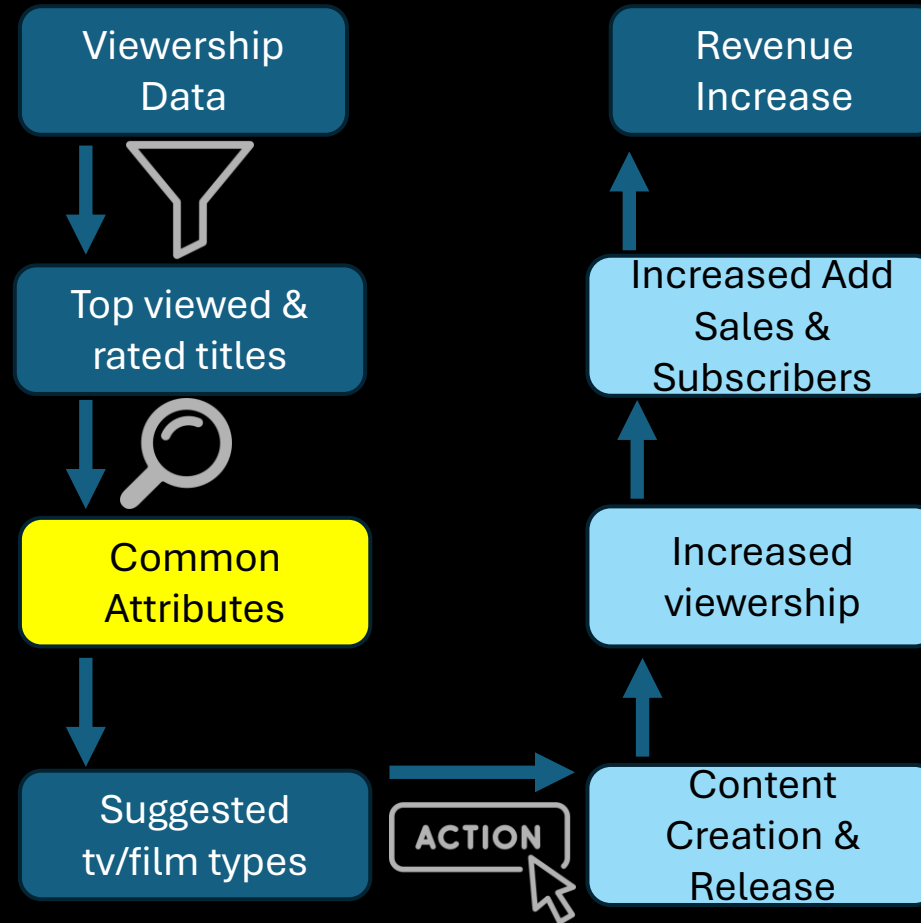

Attribute Selection

As we have already collected viewership data and narrowed it down to top viewed & rated titles, we will reveal how we uncovered the common attributes that make a title a “hit”.

We will be looking into the following:

1. *Categories*
2. *Runtime*
3. *Subsequent seasons*

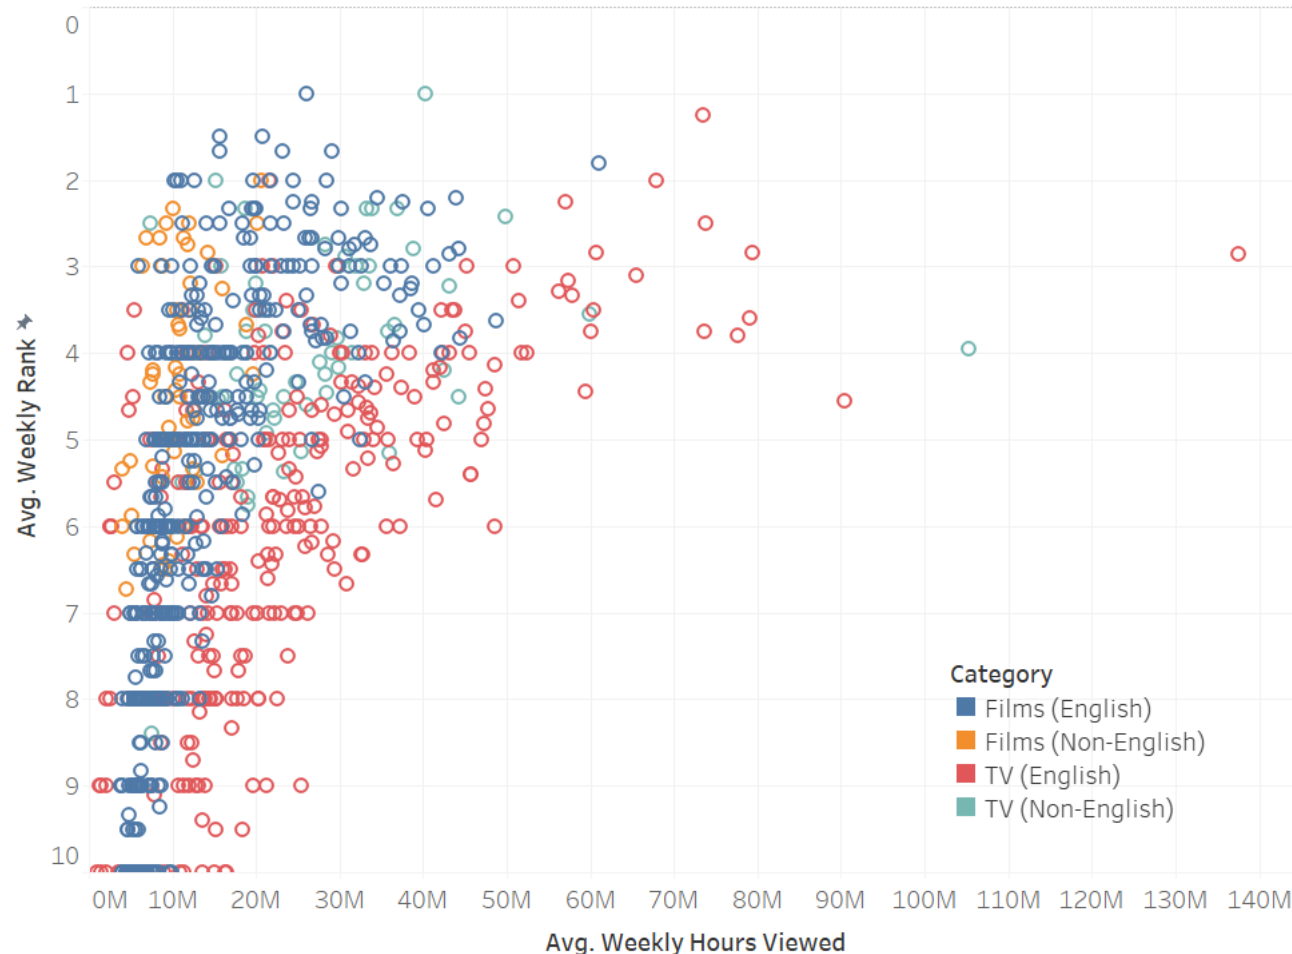

Categories

US Releases Only

We start the elimination process seeing if there are any patterns in the most viewed & rated content by category (in the US).

From our scatter plot shown the right, we can see **English TV** standing out with the most avg. hours viewed and avg. weekly rating. Since we are focusing on maximizing engagement time to enable more paid add slots & subscribers, we will focus our attention on English TV.

Clustering by Category (Avg. Hours Viewed & Rank)

Category (All-Weeks..	Avg. Weekly Hours Viewed	Avg. Weekly Rank
Films (English)	39,957,193	3
Films (Non-English)	11,066,723	5
TV (English)	66,152,357	4
TV (Non-English)	49,787,358	4

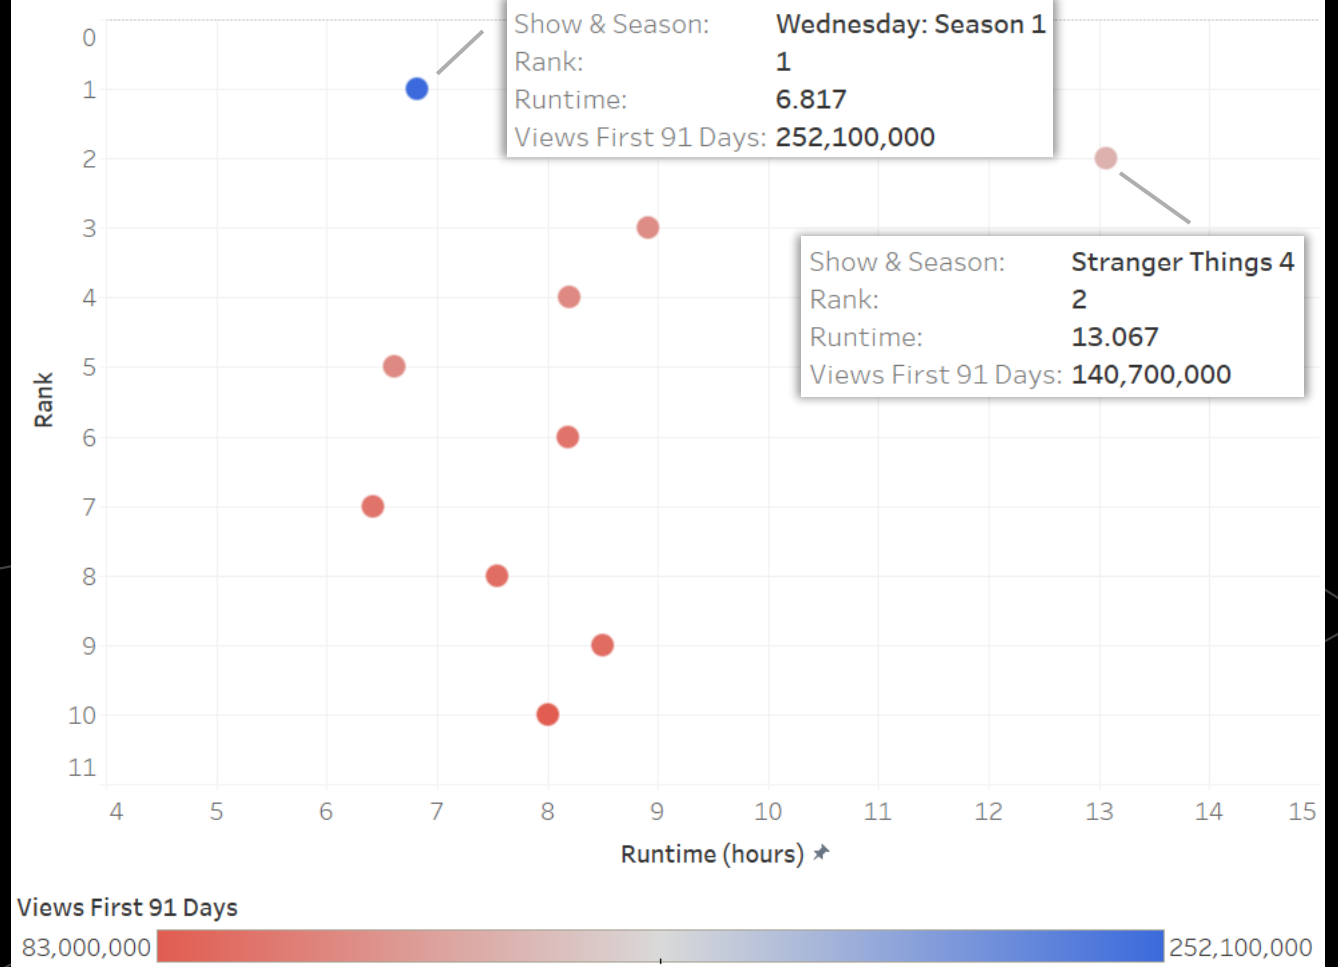

Runtime

US Releases Only

We next want to ensure that the **runtime of the TV series does not impact it's rating**. By plotting the top US TV series to the right, we can see that Runtime does not affect the ranking of the top US TV series. Meaning that we can move to other areas of focus.

Note that 'Wednesday: Season 1' stands out with a much higher count of initial views. This is worth looking more into outside of this analysis. Such as looking to see if we heavily marketed this show or if other factors impacted it's initial popularity.

Rank vs. Runtime

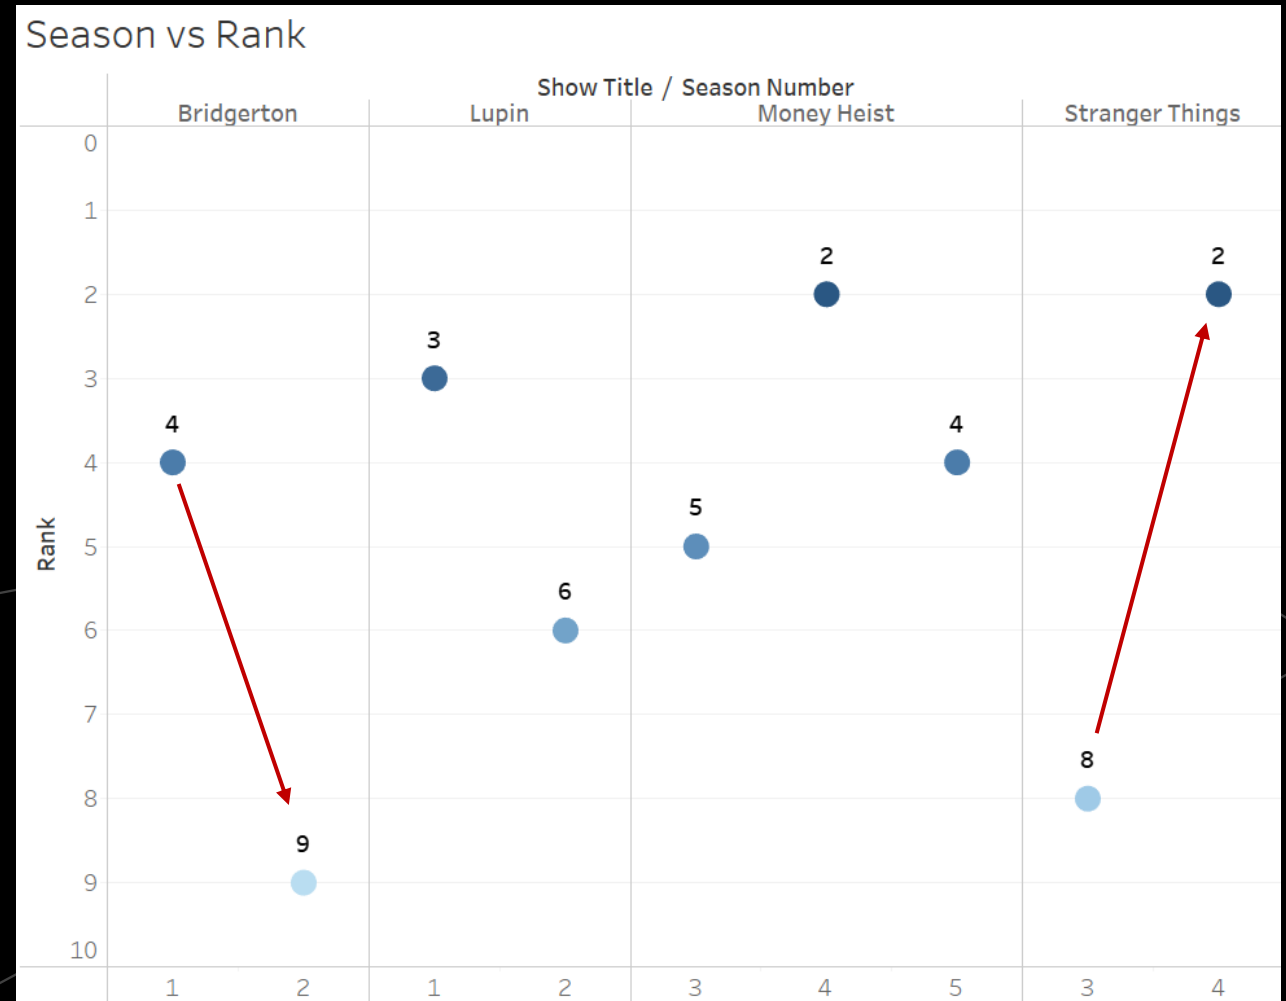

Subsequent seasons

US Releases Only

As we saw in the last slide, 'Stranger Things Season 4' was ranked number 2 in the top Netflix TV shows in the US. Does this indicate that subsequent seasons perform better since the audience already knows the show/characters?

The plot to the right shows otherwise. You can see that 'Bridgerton Season 2' ranked lower than 1. Same can be said for Lupin.

The take-away from this slide, is that **subsequent seasons do not guarantee the same rating as the prior.**

TV Rating

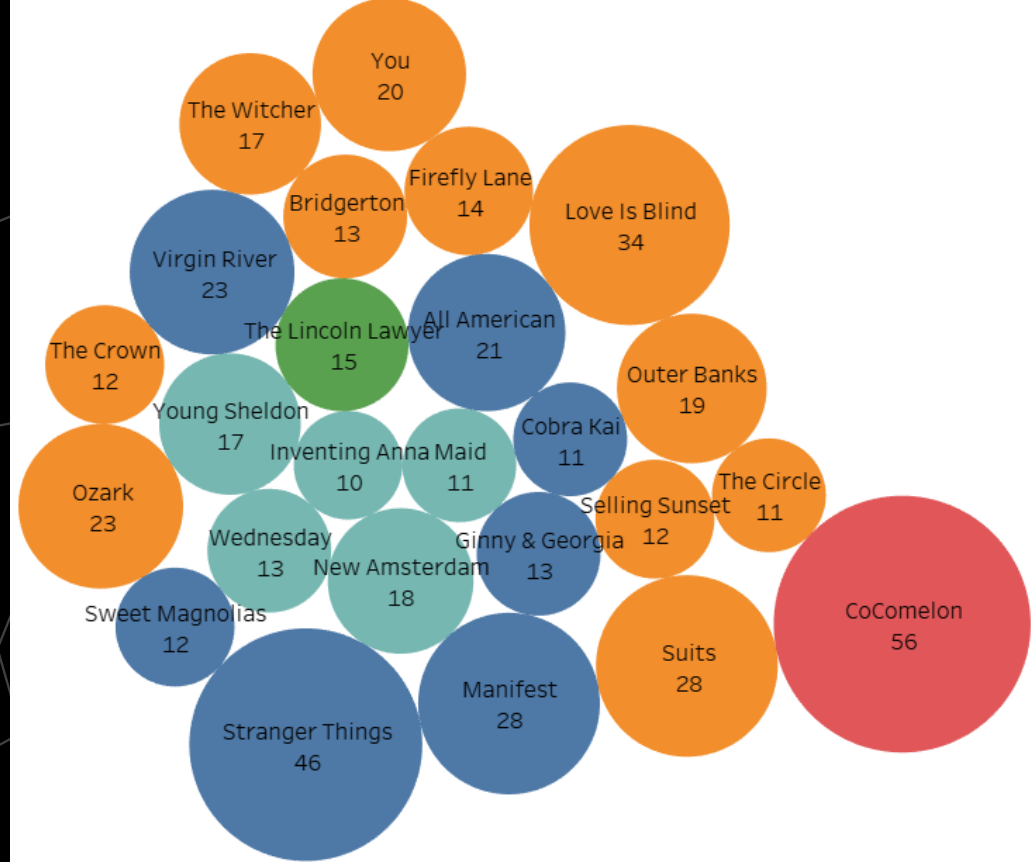

US Releases Only

As in the last slide, 'Bridgerton Season 1' and 'Stranger Things Season 4' made ranked high in the top Netflix TV shows in the US. However, does this mean that these types of shows rank high week/week? As we can see in the bubble chart to the right, 'Bridgerton' does not even make it in the view. 'Stranger Things' and 'Coco melon' on the other hand, have been seen in the top 10 US TVs for the highest number of weeks. Based on this, we have a **higher chance of being releasing a top hit if the TV Rating falls between TV-14 and TV-MA.**

Weeks in Top 10 vs. TV Parental Guidelines Rating

TV Parental Guidelines Rating

Unknown R TV-14 TV-MA TV-Y

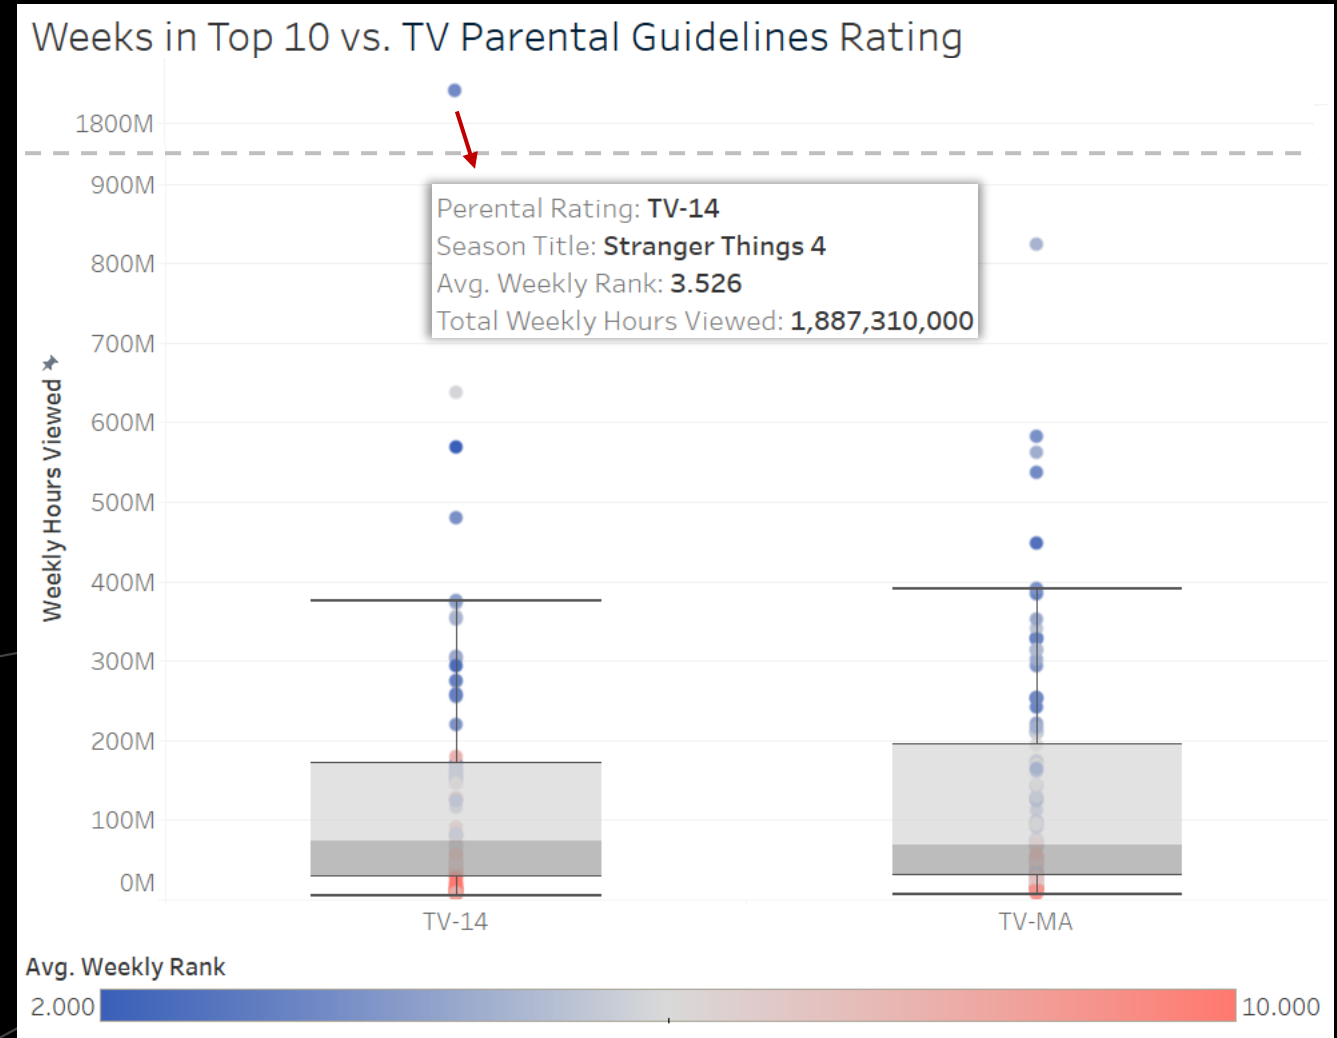

Note: We ensured that all Series listed were release before the start of data collection. Meaning that all had the same change of being top rated for each week.

TV Rating count.

US Releases Only

Taking a closer look at the difference between the top performing TV Ratings, we can see that neither one have a significantly higher average for the number of hours viewed each week. Meaning that **either of the TV show ratings (TV-14/MA)** will grant us higher view hours than the ones left out of this chart.

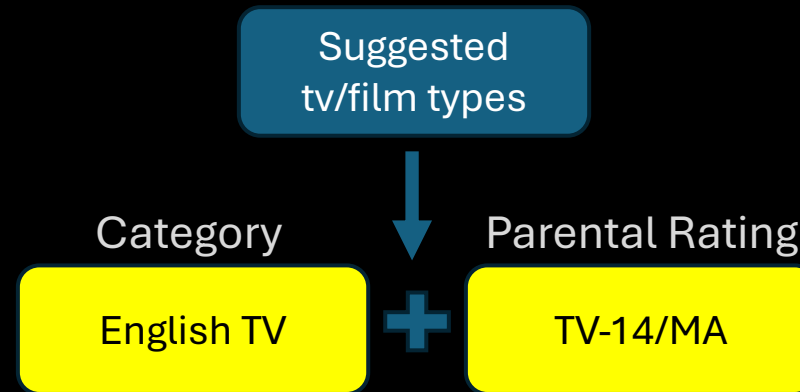

Note: 'Stagner Things Season 4' topped the charts for weekly hours viewed, due season 1-3 being released much prior to the time-frame of the data set.

Conclusion

After reviewing how the category, runtime, TV seasons, and TV rating impacted the popularity of movies and TV shows on Netflix, we have concluded that category and TV rating have the largest impact. Meaning,

The next piece of content we release should be an English TV show with a TV Parental Rating of TV-14 or TV-MA.

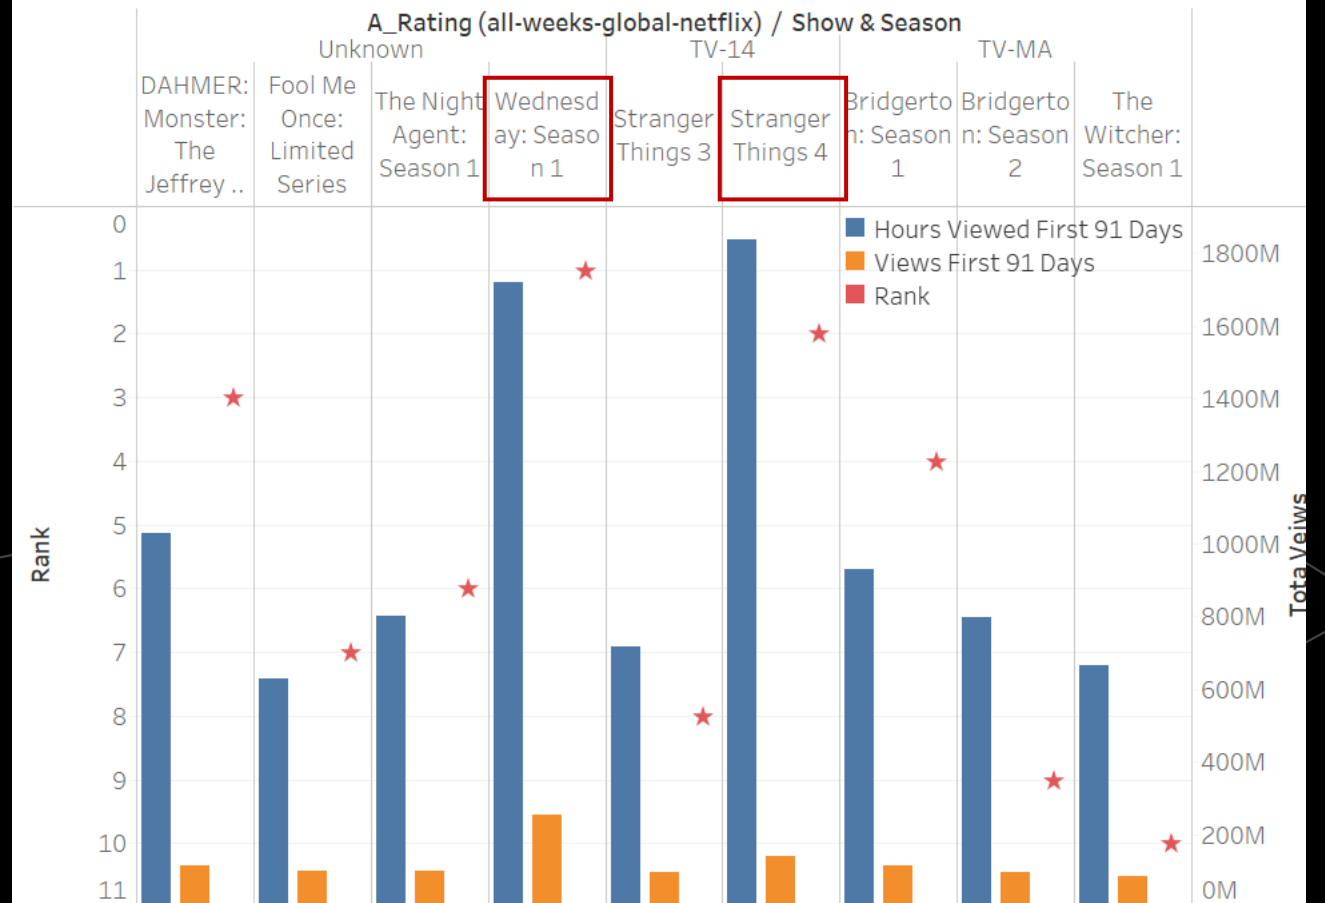

Next Steps

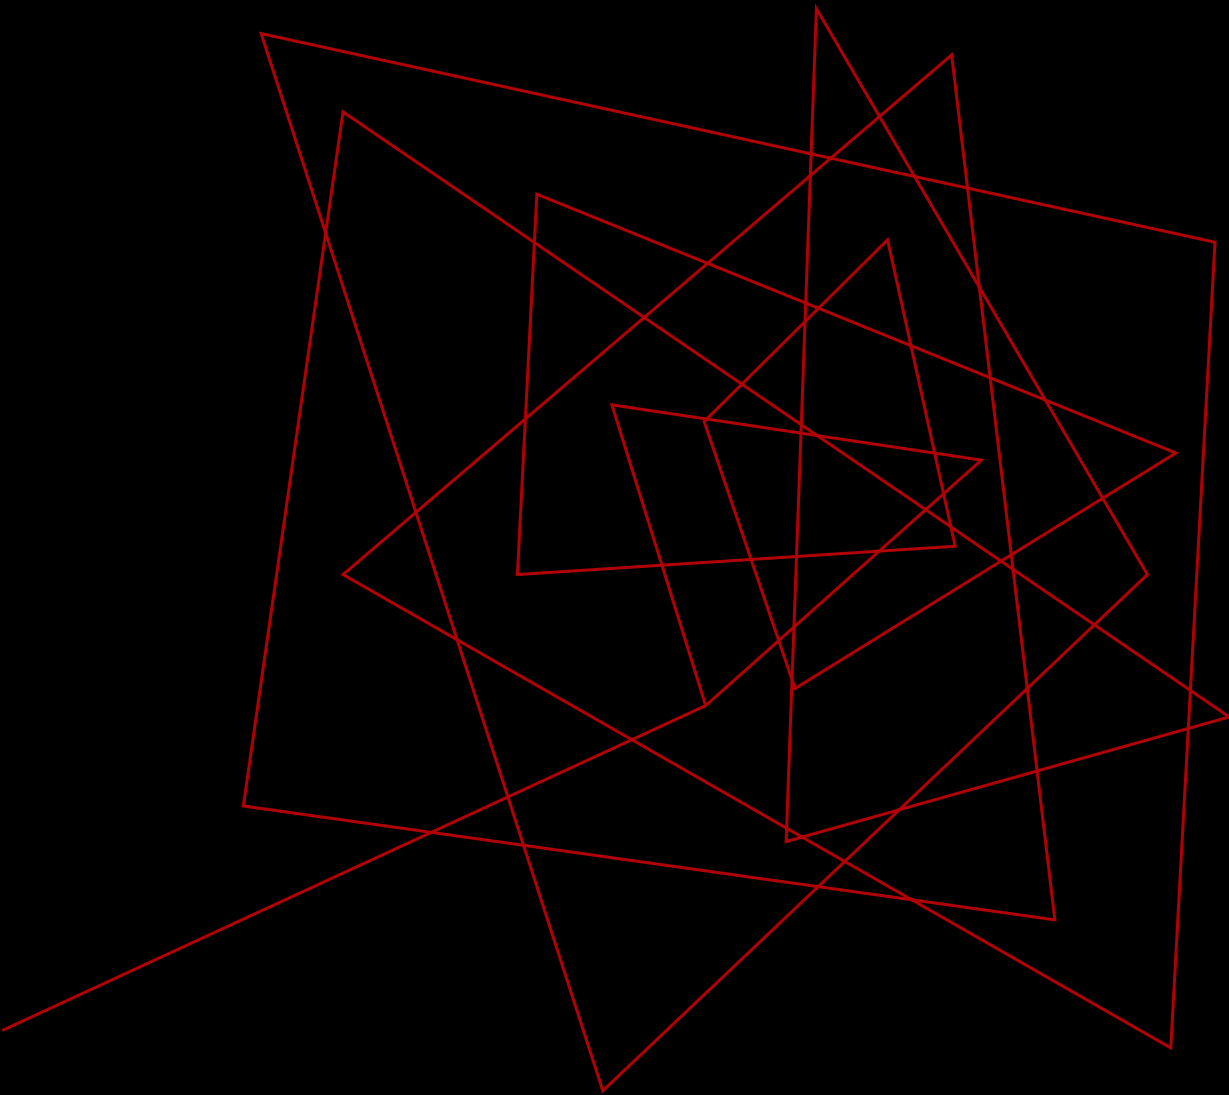

Now that we have concluded the category and parental rating, we need to understand what about these types of content make them hits.

To make action from this analysis, we will **continue with the next steps which will lead us to releasing the next hit and breaking the 10% Netflix streaming viewership mark in the US.**

1. Further investigate the content of the top TV Shows ('Wednesday' and 'Stranger Things') by digging into the details and conducting viewer surveys.
2. Look at trending shows on other platforms.
3. Create/find a TV show based on the above findings to increase viewership -> revenue -> stock price.

Top Rated US TV Shows on Netflix
