

Netflix Viewership

According to Nielsen's The Gauge™, the percentage of Netflix streaming viewership in the US, has hovered around 8% for the last year (The Gauge, 2024). There has even been a decline of 0.9% in recent months, going from 8.4% in June 2024 to 7.5% in October 2024. This shows Netflix's stagnant state in the US streaming wars. As revenue and shareholder value is the top priority, Netflix needs to focus on how to increase their footprint (% share) in streaming. In order to do so, I will be focusing on identifying what makes a movie/tv show a "hit" (top rated & viewed). By offering engaging ("hit") content, Netflix can increase viewership, add sales, subscriptions, and ultimately revenue and stock price.

Due to the nature of the goal (increased revenue and stock price), my chosen **audience** of this story will be the Netflix C-Suit executives. I have chosen this group ("I", the lead of the analytics department at Netflix) since this group has a strong pull-on what types of content is produced. After reviewing the data, my team and I have concluded that many of the variables that C-Suit teams have great influence on, impact the success of each TV/Movie released on Netflix.

The **purpose** of our presentation to the Netflix C-Suit executives, is to encourage the team to invest and release content based on our findings. This investment in high rated content will increase Netflix's share of streaming in the US and ultimately revenue and stock value.

We will be presenting the information in a PowerPoint format. We have chosen to present our findings and suggestion in this **Medium** for ease of consumption. While a live dashboard sounds tempting, we understand that C-Suit executives do not want to spend time uncovering patterns and trends themselves in a dashboard. They would like to be provided with numbers and facts and given suggestions on what to do with this information. The PowerPoint presentation lets us display static visuals and speak to them, while also allowing for live feedback (if the presentation is live). A PowerPoint can also be re-reference for further discussions with their individual teams.

The **design** of our PowerPoint will be simple and reflect the colors of the business (Netflix). Using simple fonts and backgrounds. We will also be avoiding the use of reds and greens within charts to be cognizant of those with color blindness. Therefore we will be

using many blues, as opposed to the Netflix Red we are used to. The font will also be larger than the standard 12 pt for ease of reading on large and small displays.

As we move forward with our recommendations to the Netflix C-Suite executives, it's important to highlight some **ethical considerations** that could arise during our presentation and subsequent discussions.

Our analysis concluded that one category performed better than others in the US. Favoring English TV content over others, potentially sidelining diverse voices or genres. We need to ensure that our final content suggestion (in 'Next Steps' within the presentation) promotes inclusivity and does not unintentionally exclude underrepresented groups. We could do so by ensuring that the content is also offered in other languages and includes a diverse cast.

Additionally, while focusing on driving up viewership and revenue, we need to consider the broader impact of the content we recommend producing. Ensuring that Netflix continues to offer accessible and inclusive entertainment that aligns with its values will not only contribute to long-term success but also foster goodwill with its subscribers.

By addressing these considerations, we can help Netflix grow responsibly while maintaining its reputation as an innovative and socially conscious leader in the streaming space.
